One table

N = 20,306

	Protocol +	Protocol −
Neurologist +	326	540
Neurologist −	1,277	18,163

The source prints the four cells and the first two readings. It prints no agreement coefficient, but κ and the Jaccard similarity can be computed from those cells.

Four readings

Overall accuracy — **91.1%**

counts every patient the two rules place alike, including the ones neither identifies

Sensitivity — **37.6%**

treats the neurologist as the standard and charges the shortfall to the protocol

Cohen's κ — **0.22**

treats neither rule as correct and corrects for agreement expected by chance

Jaccard similarity — **15.2%**

counts only the patients at least one rule identifies, and asks how far the two overlap
